

# Online Internship Portal

Finding suitable internship opportunities has become a challenging task for students due to the availability of information across multiple platforms such as websites, social media, college notices, and word-of-mouth references. This scattered and unorganized approach makes the process time-consuming and inefficient, often leading to confusion and missed opportunities. Through observation of existing internship search methods and interaction with students, it was identified that there is a strong need for a centralized system that can simplify the internship search and application process. This led to the formulation of the problem statement for developing an **Online Internship Portal**.

The proposed system is developed as a web-based application using technologies such as HTML5 and CSS3 for front-end design, JavaScript for client-side validation and interactivity, and a database (MySQL) for storing user and internship data. The portal allows students to register, search for internships using filters such as domain and duration, and apply online through a structured interface. An admin module is included to manage internship listings and applications, ensuring proper monitoring and control of the system.

The implementation of the Online Internship Portal provides an efficient and user-friendly platform that reduces the effort and time required for students to find internships. The centralized system improves accessibility, organization, and transparency in the internship application process. The results demonstrate that the portal effectively bridges the gap between students and internship providers by automating manual processes and improving overall efficiency.

The system requires minimal hardware and software resources, making it cost-effective and easy to deploy. The hardware requirements include a computer system with a minimum of 8 GB RAM, sufficient storage, and internet connectivity. The software requirements include a web browser, a text editor or IDE, XAMPP server, and MySQL database. These requirements ensure smooth development, execution, and scalability of the proposed system.
